

Individual Health vs. Public Health – How does anaesthesia deal with this?

Salome Meyer, Dr. med., MBA

Climate Change is – according to WHO's and many other key opinion leaders – the biggest threat humanity faces. Health care professionals are challenged by this crisis in multiple ways. Whilst they are relevant contributors to climate change given the major CO₂ emissions the health care system generates, they are also confronted with the consequences of climate change in their daily practice, treating those who suffer from it physically.

What does this mean for today's anaesthesia providers? How can they reduce their own emissions, and how can they support the required paradigm shift from individual to public health?

Salome Meyer

Head Sustainability initiative Swiss Society for Anaesthesia and Perioperative Medicine, Head Strategy and Development alphacare AG

Passionate about providing contemporary anaesthesia care that balances individual and public health care needs.
